# Axial Piston Fixed Motor A2FM

RE 91001/06.2012

1/46

Replaces: 09.07

## Data sheet

Series 6	
Size	Nominal pressure/Maximum pressure
5	315/350 bar
10 to 200	400/450 bar
250 to 1000	350/400 bar
Open and closed circuits	

## Contents

Ordering code for standard program	2
Technical data	4
Dimensions	11
Flushing and boost pressure valve	34
Pressure-relief valve	36
Counterbalance valve BVD and BVE	38
Speed sensors	42
Installation instructions	44
General instructions	46

## Features

- Fixed motor with axial tapered piston rotary group of bent-axis design, for hydrostatic drives in open and closed circuits
- For use in mobile and stationary applications
- The output speed is dependent on the flow of the pump and the displacement of the motor.
- The output torque increases with the pressure differential between the high-pressure and the low-pressure side.
- Finely graduated sizes permit far-reaching adaptation to the drive case
- High power density
- Small dimensions
- High total efficiency
- Good starting characteristics
- Economical design
- One-piece tapered piston with piston rings for sealing

# Technical data

## Hydraulic fluid

Before starting project planning, please refer to our data sheets RE 90220 (mineral oil), RE 90221 (environmentally acceptable hydraulic fluids), RE 90222 (HFD hydraulic fluids) and RE 90223 (HFA, HFB, HFC hydraulic fluids) for detailed information regarding the choice of hydraulic fluid and application conditions.

The fixed motor A2FM is not suitable for operation with HFA hydraulic fluid. If HFB, HFC or HFD or environmentally acceptable hydraulic fluids are used, the limitations regarding technical data or other seals must be observed.

### Selection diagram

## Details regarding the choice of hydraulic fluid

The correct choice of hydraulic fluid requires knowledge of the operating temperature in relation to the ambient temperature: in a closed circuit, the circuit temperature, in an open circuit, the reservoir temperature.

The hydraulic fluid should be chosen so that the operating viscosity in the operating temperature range is within the optimum range ( $v_{opt}$  see shaded area of the selection diagram). We recommended that the higher viscosity class be selected in each case.

Example: At an ambient temperature of X °C, an operating temperature of 60 °C is set in the circuit. In the optimum operating viscosity range ( $v_{opt}$ , shaded area), this corresponds to the viscosity classes VG 46 or VG 68; to be selected: VG 68.

### Note

The case drain temperature, which is affected by pressure and speed, can be higher than the circuit temperature or reservoir temperature. At no point of the component may the temperature be higher than 115 °C. The temperature difference specified below is to be taken into account when determining the viscosity in the bearing.

If the above conditions cannot be maintained due to extreme operating parameters, we recommend flushing the case at port U (sizes 250 to 1000) or using a flushing and boost pressure valve (see pages 34).

## Viscosity and temperature of hydraulic fluid

	Viscosity [mm <sup>2</sup> /s]	Temperature	Comment
Transport and storage at ambient temperature		$T_{min} \geq -50 \text{ °C}$ $T_{opt} = +5 \text{ °C to } +20 \text{ °C}$	factory preservation: up to 12 months with standard, up to 24 months with long-term
(Cold) start-up <sup>1)</sup>	$v_{max} = 1600$	$T_{St} \geq -40 \text{ °C}$	$t \leq 3 \text{ min}$ , without load ( $p \leq 50 \text{ bar}$ ), $n \leq 1000 \text{ rpm}$ (for sizes 5 to 200), $n \leq 0.25 \cdot n_{nom}$ (for sizes 250 to 1000)
Permissible temperature difference		$\Delta T \leq 25 \text{ K}$	between axial piston unit and hydraulic fluid
Warm-up phase	$v < 1600 \text{ to } 400$	$T = -40 \text{ °C to } -25 \text{ °C}$	at $p \leq 0.7 \cdot p_{nom}$ , $n \leq 0.5 \cdot n_{nom}$ and $t \leq 15 \text{ min}$
Operating phase			
Temperature difference		$\Delta T = \text{approx. } 12 \text{ K}$	between hydraulic fluid in the bearing and at port T.
Maximum temperature		115 °C	in the bearing
		103 °C	measured at port T
Continuous operation	$v = 400 \text{ to } 10$ $v_{opt} = 36 \text{ to } 16$	$T = -25 \text{ °C to } +90 \text{ °C}$	measured at port T, no restriction within the permissible data
Short-term operation <sup>2)</sup>	$v_{min} \geq 7$	$T_{max} = +103 \text{ °C}$	measured at port T, $t < 3 \text{ min}$ , $p < 0.3 \cdot p_{nom}$
FKM shaft seal <sup>1)</sup>		$T \leq +115 \text{ °C}$	see page 5

1) At temperatures below -25 °C, an NBR shaft seal is required (permissible temperature range: -40 °C to +90 °C).

2) Sizes 250 to 1000, please contact us.

# Technical data

## Filtration of the hydraulic fluid

Finer filtration improves the cleanliness level of the hydraulic fluid, which increases the service life of the axial piston unit.

To ensure the functional reliability of the axial piston unit, a gravimetric analysis of the hydraulic fluid is necessary to determine the amount of solid contaminant and to determine the cleanliness level according to ISO 4406. A cleanliness level of at least 20/18/15 is to be maintained.

At very high hydraulic fluid temperatures (90 °C to maximum 115 °C), a cleanliness level of at least 19/17/14 according to ISO 4406 is necessary.

If the above classes cannot be achieved, please contact us.

## Shaft seal

### Permissible pressure loading

The service life of the shaft seal is influenced by the speed of the axial piston unit and the case drain pressure (case pressure). The mean differential pressure of 2 bar between the case and the ambient pressure may not be enduringly exceeded at normal operating temperature. For a higher differential pressure at reduced speed, see diagram. Momentary pressure spikes ( $t < 0.1$  s) of up to 10 bar are permitted. The service life of the shaft seal decreases with an increase in the frequency of pressure spikes.

The case pressure must be equal to or higher than the ambient pressure.

### Sizes 10 to 200

### Sizes 250 to 1000

The values are valid for an ambient pressure  $p_{abs} = 1$  bar.

### Temperature range

The FKM shaft seal may be used for case drain temperatures from -25 °C to +115 °C.

### Note

For application cases below -25 °C, an NBR shaft seal is required (permissible temperature range: -40 °C to +90 °C). State NBR shaft seal in plain text when ordering. Please contact us.

## Direction of flow

### Direction of rotation, viewed on drive shaft

clockwise

counter-clockwise

A to B

B to A

## Speed range

No limit to minimum speed  $n_{min}$ . If uniformity of motion is required, speed  $n_{min}$  must not be less than 50 rpm. See table of values on page 7 for maximum speed.

## Long-life bearing

### Sizes 250 to 1000

For long service life and use with HF hydraulic fluids. Identical external dimensions as motor with standard bearings. Subsequent conversion to long-life bearings is possible. Bearing and case flushing via port U is recommended.

### Flushing flow (recommended)

NG	250	355	500	710	1000
$q_{v \text{ flush}}$ (L/min)	10	16	16	16	16

with integrated pressure-relief valve \_\_\_\_\_ 9000 bar/s

without pressure-relief valve \_\_\_\_\_ 16000 bar/s

### Note

Values for other hydraulic fluids, please contact us.

## Minimum pressure – pump mode (inlet)

To prevent damage to the axial piston motor in pump operating mode (change of high-pressure side with unchanged direction of rotation, e. g. when braking), a minimum pressure must be guaranteed at the service line port (inlet). The minimum pressure depends on the speed of the axial piston unit (see characteristic curve below).

This diagram is valid only for the optimum viscosity range from  $v_{opt} = 36$  to  $16 \text{ mm}^2/\text{s}$ .

Please contact us if these conditions cannot be satisfied.

### Definition

#### Nominal pressure $p_{nom}$

The nominal pressure corresponds to the maximum design pressure.

#### Maximum pressure $p_{max}$

The maximum pressure corresponds to the maximum operating pressure within the single operating period. The sum of the single operating periods must not exceed the total operating period.

#### Minimum pressure (high-pressure side)

Minimum pressure at the high-pressure side (A or B) which is required in order to prevent damage to the axial piston unit.

#### Summation pressure $p_{Su}$

The summation pressure is the sum of the pressures at both service line ports (A and B).

#### Rate of pressure change $R_A$

Maximum permissible rate of pressure rise and reduction during a pressure change over the entire pressure range.

$$\text{Total operating period} = t_1 + t_2 + \dots + t_n$$

1) With intermittent operation

2) Maximum permissible axial force during standstill or when the axial piston unit is operating in non-pressurized condition.

3) Conical shaft with threaded pin and woodruff key (DIN 6888)

4) Restricted technical data only for splined shaft

5) Please contact us.

6) When at a standstill or when axial piston unit operating in non-pressurized conditions. Higher forces are permissible when under pressure, please contact us.

### Note

Influence of the direction of the permissible axial force:

+F<sub>ax max</sub> = Increase in service life of bearings

-F<sub>ax max</sub> = Reduction in service life of bearings (avoid)

# Technical data

## Effect of radial force $F_q$ on the service life of bearings

By selecting a suitable direction of radial force  $F_q$ , the load on the bearings, caused by the internal rotary group forces can be reduced, thus optimizing the service life of the bearings. Recommended position of mating gear is dependent on direction of rotation. Examples:

	Toothed gear drive	V-belt output
<b>NG</b>	$\varphi_{opt}$	$\varphi_{opt}$
5 to 180	$\pm 70^\circ$	$\pm 45^\circ$
200 to 1000	$\pm 45^\circ$	$\pm 70^\circ$

## Determining the operating characteristics

Input flow  $q_v = \frac{V_g \cdot n}{1000 \cdot \eta_v}$  [L/min]

Speed  $n = \frac{q_v \cdot 1000 \cdot \eta_v}{V_g}$  [min<sup>-1</sup>]

Torque  $T = \frac{V_g \cdot \Delta p \cdot \eta_{mh}}{20 \cdot \pi}$  [Nm]

Power  $P = \frac{2 \pi \cdot T \cdot n}{60000} = \frac{q_v \cdot \Delta p \cdot \eta_t}{600}$  [kW]

$V_g$  = Displacement per revolution in cm<sup>3</sup>

$\Delta p$  = Differential pressure in bar

$n$  = Speed in rpm

$\eta_v$  = Volumetric efficiency

$\eta_{mh}$  = Mechanical-hydraulic efficiency

$\eta_t$  = Total efficiency ( $\eta_t = \eta_v \cdot \eta_{mh}$ )

Designation	Port for	Standard	Size <sup>3)</sup>	Maximum pressure [bar] <sup>4)</sup>	State <sup>8)</sup>
A, B	Service line Fastening thread A/B	SAE J518 <sup>5)</sup> DIN 13	2 in M20 x 2.5; 30 deep	400	O
T <sub>1</sub>	Drain line	DIN 3852 <sup>7)</sup>	M42 x 2; 20 deep	3	O <sup>6)</sup>
T <sub>2</sub>	Drain line	DIN 3852 <sup>7)</sup>	M42 x 2; 20 deep	3	X <sup>6)</sup>
U	Bearing flushing	DIN 3852 <sup>7)</sup>	M18 x 1.5; 12 deep	3	X
M <sub>A</sub> , M <sub>B</sub>	Measuring operating pressure	DIN 3852 <sup>7)</sup>	M14 x 1.5; 12 deep	400	X

- To shaft collar
- Center bore according to DIN 332 (thread according to DIN 13)
- Observe the general instructions on page 46 for the maximum tightening torques.
- Momentary pressure spikes may occur depending on the application. Keep this in mind when selecting measuring devices and fittings.
- Only dimensions according to SAE J518, metric fastening thread is a deviation from standard.
- Depending on installation position, T<sub>1</sub> or T<sub>2</sub> must be connected (see also installation instructions on page 44).
- The spot face can be deeper than specified in the appropriate standard.
- O = Must be connected (plugged on delivery)  
X = Plugged (in normal operation)

# Dimensions size 1000

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

# Flushing and boost pressure valve

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

The flushing and boost pressure valve is used to remove heat from the hydraulic circuit.

In an open circuit, it is used only for flushing the housing.

In a closed circuit, it ensures a minimum boost pressure level in addition to the case flushing.

Hydraulic fluid is directed from the respective low pressure side into the motor housing. This is then fed into the reservoir, together with the case drain fluid. The hydraulic fluid, removed out of the closed circuit must be replaced by cooled hydraulic fluid from the boost pump.

With port plate 027, the valve is mounted directly on the fixed motor (sizes 45 to 180, 250); with port plate 017 (sizes 355 and 500) on a plate.

### Cracking pressure of pressure retaining valve

(observe when setting the primary valve)

Sizes 45 to 500, fixed setting \_\_\_\_\_ 16 bar

### Switching pressure of flushing piston $\Delta p$

Sizes 45 to 500 \_\_\_\_\_  $8 \pm 1$  bar

### Flushing flow $q_v$

Orifice (throttles with integrated valve) can be used to set the flushing flows as required.

Following parameters are based on:

$$\Delta p_{ND} = p_{ND} - p_G = 25 \text{ bar and } v = 10 \text{ mm}^2/\text{s}$$

( $p_{ND}$  = low pressure,  $p_G$  = case pressure)

### Schematic

### Standard flushing flows

Flushing and boost pressure valve, mounted (code 7)

Size	Flushing flow $q_v$ [L/min]	$\phi$ [mm]	Mat. No. of orifice
45	3.5	1.2	R909651766
107, 125	8	1.8	R909419696
160, 180	10	2.0	R909419697
250	10	2.0	R909419697
355, 500	16	2.5	R910803019

With sizes 45 to 180, orifices can be supplied for flushing flows from 3.5 to 10 L/min. For other flushing flows, please state the required flushing flow when ordering. The flushing flow without orifice is approx. 12 to 14 L at low pressure  $\Delta p_{ND} = 25$  bar.

Flushing and boost pressure valve, integrated (code 9)

Size	Throttle $\phi$ [mm]	$q_v$ [L/min]
56, 63, 80, 90	1.5	6
	1.8	7.3

80, 90	257	186.7

## Pressure-relief valve

The MHDB pressure-relief valves (see RE 64642) protect the hydraulic motor from overload. As soon as the set cracking pressure is reached, the hydraulic fluid flows from the high-pressure side to the low-pressure side.

The pressure-relief valves are only available in combination with port plates 181, 191 or 192 (counterbalance valve for mounting to port plate 181: see next page).

Cracking pressure setting range \_\_\_\_\_ 50 to 420 bar

With the version "with pressure boost facility" (192), a higher pressure setting can be realized by applying an external pilot pressure of 25 to 30 bar to port  $P_{St}$ .

When ordering, please state in plain text:

- Cracking pressure of pressure-relief valve
- Cracking pressure with pilot pressure applied to  $P_{St}$  (only with version 192)

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

### Version without pressure boost facility "191"

1) Observe the general instructions on page 46 for the maximum tightening torques.

2) Momentary pressure spikes may occur depending on the application. Keep this in mind when selecting measuring devices and fittings.

3) O = Must be connected (plugged on delivery)

X = Plugged (in normal operation)

# Counterbalance valve BVD and BVE

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

## Function

Travel drive/winch counterbalance valves are designed to reduce the danger of overspeeding and cavitation of axial piston motors in open circuits. Cavitation occurs if the motor speed is greater than it should be for the given input flow while braking, travelling downhill, or lowering a load.

If the inlet pressure drops, the counterbalance spool throttles the return flow and brakes the motor until the inlet pressure returns to approx. 20 bar.

## Note

- BVD available for sizes 28 to 180 and BVE available for sizes 107 to 180.
- The counterbalance valve must be ordered additionally. We recommend ordering the counterbalance valve and the motor as a set. Ordering example: A2FM90/61W-VAB188 + BVD20F27S/41B-V03K16D0400S12
- The counterbalance valve does not replace the mechanical service brake and park brake.
- Observe the detailed notes on the BVD counterbalance valve in RE 95522 and BVE counterbalance valve in RE 95525!
- For the design of the brake release valve, we must know for the mechanical park brake:
  - the pressure at the start of opening
  - the volume of the counterbalance spool between minimum stroke (brake closed) and maximum stroke (brake released with 21 bar)
  - the required closing time for a warm device (oil viscosity approx. 15 mm<sup>2</sup>/s)

## Travel drive counterbalance valve BVD...F

### Application option

- Travel drive on wheeled excavators

### Example schematic for travel drive on wheeled excavators A2FM090/61W-VAB188 + BVD20F27S/41B-V03K16D0400S12

## Ports

Designation	Port for	Version	Standard	Size <sup>1)</sup>	Maximum pressure [bar] <sup>2)</sup>	State <sup>4)</sup>
A, B	Service line		SAE J518	see table above	420	O
S	Infeed	BVD20	DIN 3852 <sup>3)</sup>	M22 x 1.5; 14 deep	30	X
		BVD25, BVE25	DIN 3852 <sup>3)</sup>	M27 x 2; 16 deep	30	X
Br	Brake release, reduced high pressure	L	DIN 3852 <sup>3)</sup>	M12 x 1.5; 12.5 deep	30	O
G <sub>ext</sub>	Brake release, high pressure	S	DIN 3852 <sup>3)</sup>	M12 x 1.5; 12.5 deep	420	X
M <sub>A</sub> , M <sub>B</sub>	Measuring pressure A and B		ISO 6149 <sup>3)</sup>	M12 x 1.5; 12 deep	420	X

1) Observe the general instructions on page 46 for the maximum tightening torques.

2) Momentary pressure spikes may occur depending on the application. Keep this in mind when selecting measuring devices and fittings.

3) The spot face can be deeper than specified in the appropriate standard.

4) O = Must be connected (plugged on delivery)

X = Plugged (in normal operation)

# Counterbalance valve BVD and BVE

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

## Mounting the counterbalance valve

When delivered, the counterbalance valve is mounted to the motor with two tacking screws (transport protection). The tacking screws may not be removed while mounting the service lines. If the counterbalance valve and motor are delivered separately, the counterbalance valve must first be mounted to the motor port plate using the provided tacking screws. The counterbalance valve is finally mounted to the motor by screwing on the SAE flange with the following screws:

6 screws (1, 2, 3, 4, 5, 8) \_\_\_\_\_ length B1+B2+B3  
 2 screws (6, 7) \_\_\_\_\_ length B3+B4

Tighten the screws in two steps in the specified sequence from 1 to 8 (see following scheme).

In the first step, the screws must be tightened with half the tightening torque, and in the second step with the maximum tightening torque (see following table).

Thread	Strength class	Tightening torque [Nm]
M6 x 1 (tacking screw)	10.9	15.5
M10	10.9	75
M12	10.9	130
M14	10.9	205

Size	28, 32, 45	56, 63	80, 90	107, 125, 160, 180	107, 125
Port plate	18				17
B1 <sup>1)</sup>	M10 x 1.5; 17 deep	M10 x 1.5; 17 deep	M12 x 1.75; 18 deep	M14 x 2; 19 deep	M12 x 1.75; 17 deep
B2	78 <sup>2)</sup>	68	68	85	68
B3	customer-specific				
B4	M10 x 1.5; 15 deep	M10 x 1.5; 15 deep	M12 x 1.75; 16 deep	M14 x 2; 19 deep	M12 x 1.75; 17 deep

1) Minimum required thread reach 1 x ø-thread

2) Including sandwich plate

# Speed sensors

The versions A2FM...U and A2FM...F ("prepared for speed sensor", i.e. without sensor) is equipped with a toothed ring on the rotary group.

On deliveries "prepared for speed sensor", the port is plugged with a pressure-resistant cover.

With the DSA or HDD speed sensor mounted a signal proportional to motor speed can be generated.

The sensors measures the speed and direction of rotation.

Ordering code, technical data, dimensions and details on the connector, plus safety information about the sensor can be found in the relevant data sheet.

DSA \_\_\_\_\_ RE 95133

HDD \_\_\_\_\_ RE 35135

The sensor is mounted at the specially provided port D as follows:

DSA \_\_\_\_\_ with one mounting bolt

HDD \_\_\_\_\_ with two mounting bolts

We recommend ordering the A2FM fixed motor complete with sensor mounted.

## Version "V"

Sizes 23 to 200 with DSA sensor

## Version "V"

# Installation instructions

## General

During commissioning and operation, the axial piston unit must be filled with hydraulic fluid and air bled. This must also be observed following a relatively long standstill as the axial piston unit may drain back to the reservoir via the hydraulic lines.

Particularly in the installation position "drive shaft upwards" filling and air bleeding must be carried out completely as there is, for example, a danger of dry running.

The case drain fluid in the motor housing must be directed to the reservoir via the highest available drain port ( $T_1, T_2$ ).

For combinations of multiple units, make sure that the respective case pressure in each unit is not exceeded. In the event of pressure differences at the drain ports of the units, the shared drain line must be changed so that the minimum permissible case pressure of all connected units is not exceeded in any situation. If this is not possible, separate drain lines must be laid if necessary.

To achieve favorable noise values, decouple all connecting lines using elastic elements and avoid above-reservoir installation.

In all operating conditions, the drain line must flow into the reservoir below the minimum fluid level.

## Installation position

See the following examples 1 to 8.

Further installation positions are possible upon request.

Recommended installation positions: 1 and 2.

### Note

With sizes 10 to 200 with installation position "shaft upward", an air-bleed port R is required (state in plain text when ordering - special version). With sizes 250 to 1000, port U is provided as standard in the area near the bearings for air bleeding.

Installation position	Air bleed	Filling
1	-	$T_1$
2	-	$T_2$
3	-	$T_1$
4	R (U)	$T_2$
5	$L_1$	$T_1$ ( $L_1$ )
6	$L_1$	$T_2$ ( $L_1$ )
7	$L_1$	$T_1$ ( $L_1$ )
8	R (U)	$T_2$ ( $L_1$ )

- $L_1$  Filling / air bleed
- R Air bleed port (special version)
- U Bearing flushing / air bleed port
- $T_1, T_2$  Drain port
- $h_{t\ min}$  Minimum required immersion depth (200 mm)
- $h_{min}$  Minimum required spacing to reservoir bottom (100 mm)

## Below-reservoir installation (standard)

Below-reservoir installation means that the axial piston unit is installed outside of the reservoir below the minimum fluid level.

## Above-reservoir installation

Above-reservoir installation means that the axial piston unit is installed above the minimum fluid level of the reservoir.

Recommendation for installation position 8 (drive shaft upward): A check valve in the drain line (cracking pressure 0.5 bar) can prevent draining of the motor housing.

HYDROMIA

## General instructions

- The motor A2FM is designed to be used in open and closed circuits.
- The project planning, installation and commissioning of the axial piston unit requires the involvement of qualified personnel.
- Before using the axial piston unit, please read the corresponding instruction manual completely and thoroughly. If necessary, these can be requested from Bosch Rexroth.
- During and shortly after operation, there is a risk of burns on the axial piston unit. Take appropriate safety measures (e. g. by wearing protective clothing).
- Depending on the operating conditions of the axial piston unit (operating pressure, fluid temperature), the characteristic may shift.
- Service line ports:
  - The ports and fastening threads are designed for the specified maximum pressure. The machine or system manufacturer must ensure that the connecting elements and lines correspond to the specified application conditions (pressure, flow, hydraulic fluid, temperature) with the necessary safety factors.
  - The service line ports and function ports can only be used to accommodate hydraulic lines.
- The data and notes contained herein must be adhered to.
- The product is not approved as a component for the safety concept of a general machine according to ISO 13849.
- The following tightening torques apply:
  - Fittings:
    - Observe the manufacturer's instructions regarding tightening torques of the fittings used.
  - Mounting bolts:
    - For mounting bolts with metric ISO thread according to DIN 13 or with thread according to ASME B1.1, we recommend checking the tightening torque in individual cases in accordance with VDI 2230.
  - Female threads in the axial piston unit:
    - The maximum permissible tightening torques  $M_{G \max}$  are maximum values for the female threads and must not be exceeded. For values, see the following table.
  - Threaded plugs:
    - For the metallic threaded plugs supplied with the axial piston unit, the required tightening torques of threaded plugs  $M_V$  apply. For values, see the following table.

Ports		Maximum permissible tightening torque of the female threads $M_{G \max}$	Required tightening torque of the threaded plugs $M_V^{1)}$	WAF hexagon socket of the threaded plugs
Standard	Size of thread			
DIN 3852 <sup>1)</sup>	M10 x 1	30 Nm	15 Nm <sup>2)</sup>	5 mm
	M12 x 1.5	50 Nm	25 Nm <sup>2)</sup>	6 mm

DIN ISO 228	G 1/4	40 Nm	-	-

1) The tightening torques apply for screws in the "dry" state as received on delivery and in the "lightly oiled" state for installation.

2) In the "lightly oiled" state, the  $M_V$  is reduced to 10 Nm for M10 x 1 and 17 Nm for M12 x 1.5.
